

BORA-CARE[®]

Termiticide, Insecticide, Fungicide

Bora-Care is a termite treatment that is applied to wood and other construction materials.

Bora-Care replaces soil termiticides in new construction and serves as a primary termite treatment on the HUD-99-A form. Bora-Care can also be used as a remedial treatment to treat homes that have been infested by termites, beetles or carpenter ants. Once Bora-Care is applied to the wood, it remains in the wood for the life of the structure, delivering long-term residual protection. It will protect interior wood as well as exterior wood that remains painted or sealed.

Bora-Care's proprietary borate-based glycol formulation improves penetration to help kill and prevent infestation from:

- termites
- carpenter ants
- wood boring beetles
- decay fungi

Applying Bora-Care to a structure is a sustainable choice for builders, and they can earn green points in many green building programs by using Bora-Care for their termite pretreatments. Bora-Care also offers a 30-year damage repair warranty to Pest Management Professionals who register their homes and inspect them annually.

More than 2,000,000 homes have been treated with Bora-Care.

Opportunity knocks on wood.

Wood is the most expensive component of a home—protect it with Bora-Care.
